

API Installation instructions

1) Download the SDK from <https://www.emotion-tuning.com>

Note: Advanced developers can find the latest version at <https://github.com/emotion-tuning/sdk/>

Note: Our SDK is server-independent, but we have included a PHP implementation example.

2) Extract the files to your computer

3) Adjust the looks

You need a basic HTML and CSS knowledge to do this - you might ask a webdesigner to help you out.

The layout changes are to be made in `index.htm` and `_assets/css/emotion-base.css`.

If you need to change the color scheme, edit the `_assets/css/emotion-style.css`.

The two options

Microsite

1) Open up your FTP client and connect to your hosting provider

2) Create a new folder, e.g. "emotion" (without quotes)

3) Upload ALL files to the new folder

4) Now you can enter the page under `www.yoursite.co.uk/emotion` (where emotion is the name of the folder you created)

5) Add that link to your website & share!

A widget in your existing website

Warning: We recommend this procedure to be performed by a professional. Inconsiderate manipulation with your website code can damage or completely disable your site.
Make sure to back up the files you are about to edit.

1) Open up your FTP client and connect to your hosting provider

2) Download the files you will edit & make a backup

Notes: You are usually looking for `index.html` or `index.php` file.
If you are using WordPress or Joomla, search for the actual theme folder and look up the main page template.

3) Open `index.htm` from the extracted SDK files in a text/code editor

4) Select and copy the code between `<!-- emotion widget start -->` and `<!-- emotion widget end -->` comments

5) Open your site's file and insert copied code in the place where you want the widget to appear

5) Replace `INSERT_EMOTION_API_KEY_HERE` with an actual key

6) Add all required scripts & styles. In `index.htm`, copy all the code between `<!-- emotion dependencies start -->` and `<!-- emotion dependencies end -->` comments.

7) Paste it in your site's file just before the closing `</html>` tag.

Notes: Our SDK is using jQuery. If you are using jQuery in your site,
remove our reference.

8) Upload the changed file back to your server and check your site.
